PT New mammalian Soluble interferon alpha-receptor forms - used for prinhibiting, modulating or modifying the activities of interferon(s) PS Example 2; Fig 7; 46pp; English.

CC (W21805) Is characterised by a new domain (S) which follows an CC end-deleted extracellular domain when compared to transmembraneal CC IFNAR (W21804). There is no transmembrane domain. The amino acid CC sequence is predicted from a cDNA clone (see also T73520) obtd.

CC from human myeloma U266 cells. Soluble, non-membrane bound IFNAR CC splice-deleted forms 1 and 2 (see also W21806) probably regulate CC the response of human cells to IFNS, either by acting as IFN CC antagonists or by regulating the activity of the multiple IFN CC subtypes. They can be expressed in host cells and used to inhibit, CC modulate or modify the activities of IFNS alpha and beta in cells, tissues and organisms, or for diagnostic purposes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 (YEDA) YEDA RES 6 DEV C. WPI: 91-319778/44.

N-PSDB; Q14239.

New water-soluble polypeptide(s) with affinity for IFN-alpha and beta - used to treat e.g. lupus erythematosus, Behcet's disease, aplastic anaemia, diabetes mellitus, rheumatoid arthritis, etc. Claim 2; Page 45; Szpp; French.

The transmembrane and cytoplasmic domains of the native IFN receptor have been deleted to obtain a soluble, circulating form of the receptor. Potentially immunogenic epitopes have thus been eliminated. Derivatives obtained by substitution or deletion of this sequence are also claimed as are hybrid molecules comprising the soluble receptor (or deriv.) and an immunoglobulin such as IgG1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          351
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 251

seq_name:
New mammalian soluble interferon alpha-receptor forms - used for inhibiting, modulating or modifying the activities of interferon(s) Example 3; Fig 7; 46pp; English.

C (W21806) is characterised by a double deletion when compared to transmembranal IFNAR (W21804). The extracellular domain in transment in the extracellular domain. The amino acid residues and is followed by a truncated intracellular domain. There is no transmembrane region. The amino acid sequence is predicted from a conductor (see also T73521) obtd. From human myeloma U266 cells. Soluble, non-membrane bound IFNAR police deleted forms 1 (see also W21805) and 2 may regulate the response of human cells to IFNS, either by acting as IFN antagonists or by regulating IFN activities. They can be expressed activities of IFNs alpha and beta in cells, tissues and organisms, Sequence 495 AA;
                                                                                                                                                                                                                                                                                                                                                                                                    11-MAY-1995.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  17
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         51
New human alpha-interferon receptor protein - useful for testing interferon agonists and in treatment or diagnosis pisclosure; fig 4; 30pp; French.

Disclosure: fig 4; 30pp; French.

This recombinant human alpha interferon (IFN) receptor protein is useful for the testing of IFN agonists and for treatment and diagnosis of viral diseases and tumours. Antibodies raised against this protein can be used for blocking the receptor when required, eg where overexpression of alpha-IFN is harmful. The Abs are eg where overexpression of alpha-IFN is harmful. The Abs are halso useful for eg drug targetting. Variants of the protein, having residues 164 (Thr) replaced by Arg and an Asp inserted between residues 479 and 480, are also useful.

Sequence 557 AA;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 101
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           301
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            251
                   New water-soluble polypeptide(s) with affinity for IFN-alpha and beta - used to treat e.g. lupus erythematosus, Behcet's disease, beta - used to treat e.g. lupus erythematosus, Behcet's disease, beta - used to treat e.g. lupus erythematosid arthritis, etc. aplastic anaemia, diabetes mellitus, rheumatoid arthritis, etc. pisclosure; Page 47; 52pp; French.

The invention covers derivatives of the interferon-alpha and/or beta receptor obtained by deleting the transmembrane and cytoplasmic domains of the native receptor or by substitution. Potentially immunogenic of the native receptor or by substitution. Potentially immunogenic epitopes are eliminated and the deriv. can be secreted from epitopes are eliminated and the deriv. Block the activity of IFN alpha/beta and can be used to treat autoimmune diseases or to inhibit graft
                                                                                                                                                                                                                                                                                                                                                                                                                                                   117
                                                                                                                                                                                                                                                                                                                                                                                                                                                                           351

water soluble polypeptide(s) strongly bind interferon(s) alpha and beta - useful as immunosuppressants, for treating auto:immune diseases and transplant rejection
Claim 3; Fig 2; 58pp; English.
DNA encoding the water-soluble polypeptide with a high affinity for IFN-alpha and -beta is isolated by PCR, using appropriate oligonucleotides as primers and cloned cDNA as template. For example, bacteriophage lambda ZAP, containing the entire coding sequence of the IFN-alpha and -beta receptor (Q30533), was incubated with oligos Q30534 and Q30535. R28496 represents the complete receptor. R28495 lacks the transmembrane and cytoplasmic domains. Both forms bind
                                                                                                                                                                                                                                                                                                                                                                                                                                    documentation_block:

The antibodies are useful for treatment prophylaxis of disorders involving cell proliferation and/or vinfection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         neutralising activity against human type I interferon, therapy and diagnosis Disclosure; Fig 3; 21pp; English.

The amino acid sequence of human interferon class I receptor is given in R75356. A recombinant soluble form of the extracellular domain of this receptor (R71723) has been used to raise immunomodulatory monocional antibodies.

New manmalian soluble interferon alpha-receptor forms - used for inhibiting, modulating or modifying the activities of interferon(s) Disclosure; Fig 7; 46pp; English.
Human transmembranal interferon alpha receptor (IFNAR) (W21804) includes a 21-amino acid transmembrane region. Novel, splice-deleted IFNAR forms 1 (W21805) and 2 (W21806) have been detected that lack this transmembrane domain. These, soluble non-membrane bound polyapptides can be expressed in host cells and used to inhibit, modulate or modify the activities of interferons alpha and beta in cells, tissues and organisms, or for diagnostic

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               PT Novel human Zcytor7 DNA encodes a type 2 cytokine receptor - useful for treating renal, neural, pancreatic and prostatic diseases Claim 1; Pages 55-59; 72pp; English.

CC This represents the Zcytor7 cytokine receptor. Zcytor7 is a ligand-binding receptor polypeptide and is a novel member of the type 2 cytokine receptor family (CRF2). An expression vector containing the Zcytor colynucleotide, operably linked to transcription promoter, a sequence encoding a transmembrane and intracellular domain, or both, and a transcriptional terminator can be used to transcription production of the polypeptide. The sequences can be used to study the Zcytor7 gene and to isolate ligands binding to it. Zcytor7 is preferentially expressed in the kidney, pancreas, prostate or nervous tissue. Agonists of Zcytor7 can be used to stimulate proliferation and 2C differentiation of cell in these organs. The antagonists and agonists can also be used in the treatment of renal, neural, pancreatic and prostate
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Align seg 1/1 to: W79159

PS Claim 2; Page -; 79pp; English.

CC rimis sequence is the human CRFB4 sequence, DNA encoding it is used in the CC recombinant DNA (I) of the invention. (I) comprises a sequence (S1) CC encoding the interleukin-10 (IL-10) receptor (IL10R) and a sequence (S2) CC encoding CRFB4, both operably linked to expression control sequences. CC cells containing (I) may be used to identify agonists/antagonist of CC cells containing (I) may be used to identify agonists/antagonists of inflammation, autoimmune disease and septic shock, while antagonists are potentially useful for increasing immune responses against tumours, cc potentially useful for increasing immune responses against tumours, and criminal repetution. A vector containing (I) is used to compreventing organ rejection. A vector containing (I) is used to compreventing and is able to bind IL-10 but not to transduce a dysfunctional IL10R and is able to bind IL-10 but not to transduce a signal. Antisense CRFB4 sequences (especially ribozymes), can inhibit compression of activity in cells. Antibodies specific for CRFB4 are used to reasure and localise CRBF4, for diagnosis of defective IL-10 activity. Can inhibit compression of the compression of th
                                                                                                                                                                                                                                                                                                                                                                                                                                                  alignment_block:

The sequence was deduced from the nucleotide sequence (see (x24379) of a cDNA clone obtained from pancreatic islet cDNA (library. Ccytoril is a cell surface receptor that is expressed in cpancreas, small intestine, colon and thymus. Novel Ccytoril (polypeptides, especially an extracellular domain (see W97864) of czytoril, can be used to detect ligands that promote the proliferation and/or differentiation of these organs. The invention provides claimed expression vectors and transformed or transfected cells, as well as an antibody that specifically binds to the extracellular domain of Ccytoril, and an anti-idiotyptic antibody. The vectors include a promoter, a terminator and DNA encoding the extracellular domain, signal sequence, transmembrane domain or intracellular domain of Ccytoril.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Align seg 1/1 to: W97861 from: 1 to:

The IFN-gamma receptor beta-subunit encoded by a cDNA clone derived from mouse B-cells is given in R75782. Recombinant beta-subunit, pref. with the transmembrane anchoring domain deleted or inactivated and with the cytoplasmic domain deleted, may be used to treat pathological conditions associated with endogenous
